# Class 6: R Functions

Onyeka (PID: A59011964)

10/15/2021

# Quick Rmarkdown intro

We can write text of course just like any file. We can  $\mathbf{style}$   $\mathbf{text}$  to  $\mathbf{be}$   $\mathbf{bold}$  or italic.

 $\mathrm{Do}:$ 

- this
- $\bullet \;$  and that
- $\bullet\,$  and another thing

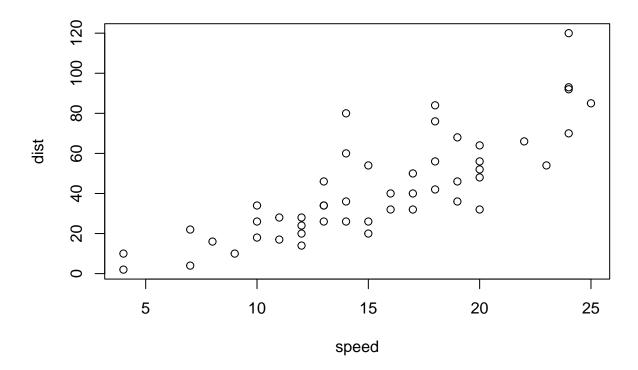

THis is more text		
and this is a new line		
•		

We can include some code:

plot(1:10)

# This is a comment and will not be passed to R plot(cars)

## Time to write a function

Q1. Write a function grade() to determine an overall grade from a vector of student homework assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an NA value) this can be used as a score to be potentially dropped. Your final function should be adquately explained with code comments and be able to work on an example class gradebook such as this one in CSV format: "https://urldefense.proofpoint.com/v2/url?u=https-3A\_\_tinyurl.com\_gradeinput-25C3-25A2&d=DwIGAw&c=-35OiAkTchMrZOngvJPOeA&r=IPgcjs6g9Kma4M25NPduLgnYFJm5\_h4xbxbLckrZjck&m=12LKMVGw5zlKvrRGDdgU1l0uLmPeVYT250TKgDYTsxM&s=Vuk3hQYyp11dAMN\_1SNi\_6uUdIFAKqbyMaCDL6FUH3k&e=?? [3pts]

```
# Example input vectors to start with
student1 <- c(100, 100, 100, 100, 100, 100, 90)
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
```

First I want to find the lowest score. I can use the **min()** to find it and the **which.min()** function to find where it is (i.e. its position in the vector).

```
which.min(student1)
```

## [1] 8

I can use minus to get everything in the vector but the lowest score.

```
student1[ -which.min(student1) ]
## [1] 100 100 100 100 100 100 100
Now I can call thr mean() function to get the average.
mean(student1[ -which.min(student1) ])
## [1] 100
Does this work for student2?
mean(student2[ -which.min(student2) ])
## [1] NA
NO! Why not?
{\tt student2}
## [1] 100 NA 90 90
                         90
                             90
which.min(student2)
## [1] 8
mean(student2, na.rm=TRUE)
## [1] 91
student2
## [1] 100 NA 90 90 90 97 80
One great idea is to replace the NA values with zero. Let's do it.
The internet gods told me to try this
which(is.na(student2))
## [1] 2
```

The is.na() function returns a logical vector where TRUE elements indicate the presence of NA values.

```
is.na(student2)
## [1] FALSE TRUE FALSE FALSE FALSE FALSE FALSE
student2[ is.na(student2) ]
## [1] NA
Lets replace NAs with zero
student.prime <- student2</pre>
student.prime[ is.na(student.prime)] = 0
student.prime
## [1] 100  0  90  90  90  97  80
x < -1:5
## [1] 1 2 3 4 5
x[2] = 100
## [1]
         1 100
                 3
                          5
x[3] = 200
## [1]
         1 100 200
                          5
Ok we are so so close lets put these bits together to get our mean excluding the lowest score.
student.prime <- student2</pre>
student.prime[ is.na(student.prime)] = 0
mean(student.prime[ -which.min(student.prime) ])
## [1] 91
How about student3?
student.prime <- student3</pre>
student.prime[ is.na(student.prime)] = 0
mean(student.prime[ -which.min(student.prime) ])
## [1] 12.85714
```

Great! We got it. this works. Lets simplify and make as clear as we can.

We can make the object names more clear

```
x <- student3
x[ is.na(x)] = 0
mean(x[ -which.min(x) ])

## [1] 12.85714

Doh! eeijt Barry entered the data wrong...

student4 <- c(100, NA, 90, "90", 90, 97, 80)

x <- student4
x <- as.numeric(x)
x[ is.na(x)] = 0</pre>
```

## [1] 91

mean(x[ -which.min(x) ])

Now finally we can write our function: All functions have at least 3 things. A name, input args and a body.

```
grade <- function(x) {
    x <- as.numeric(x)
    x[ is.na(x)] = 0
    mean(x[ -which.min(x) ])
}</pre>
```

And test if it works on a single vector.

```
grade(student1)
```

## [1] 100

# Now grade a whole class

First we got to read the gradebook for the class.

```
gradebook <- "https://urldefense.proofpoint.com/v2/url?u=https-3A__tinyurl.com_gradeinput&d=DwIGAw&c=-3
scores <- read.csv(gradebook, row.names=1)
scores</pre>
```

```
##

                            89
                                 NA
               92 100
                        74
                            89
## student-16
                                 77
               88
## student-17
                    63 100
                            86
## student-18
               91
                    NA 100
                            87 100
## student-19
               91
                    68
                        75
                            86
                                 79
## student-20
                            88
               91
                    68
                        76
                                76
```

We are going to use the supper useful apply() function to grade all the students with our grade() function.

```
ans <- apply(scores, 1, grade)</pre>
ans
##
    student-1
               student-2
                           student-3
                                       student-4
                                                   student-5
                                                               student-6
                                                                           student-7

                                                                               87.75
##
   student-15 student-16 student-17 student-18 student-19 student-20
##
        78.75
                    89.50
                                88.00
                                            94.50
                                                       82.75
                                                                   82.75
```

**Q2.** Who is the top scoreing student

```
which.max(ans)

## student-18
## 18
```

Q3. From your analysis of the gradebook, which homework was toughest on students (i.e. obtained the lowest scores overall? [2pts]

Here I will use the apply() function again but this time look at the columns, which represent different homeworks.

```
apply(scores,2,mean)

## hw1 hw2 hw3 hw4 hw5

## 89.0 NA 80.8 NA NA

I can ignore the NA missing values with na.rm=TRUE
```

```
apply(scores,2,mean, na.rm=TRUE)
```

```
## hw1 hw2 hw3 hw4 hw5
## 89.0000 80.88889 80.80000 89.63158 83.42105
```

Replace or mask NA values to zero

```
mask <- scores
is.na(mask)
              hw1
##
                   hw2
                        hw3
                              hw4
                                   hw5
## student-1 FALSE FALSE FALSE FALSE
## student-2 FALSE FALSE FALSE FALSE

                  69
                      77 100
                              77
## student-4
              88
                   0
                      73 100
                              76
## student-5
              88 100
                     75
                          86
## student-6
              89 78 100
                          89 77
## student-7
              89 100
                      74
                          87 100
## student-8
              89 100
                      76
                          86 100
## student-9
              86 100
                      77
                          88 77
                          0 76
## student-10 89
                  72
                      79
## student-11 82
                  66
                      78
                          84 100
## student-12 100
                  70
                      75
                          92 100
## student-13 89 100
                      76 100 80
## student-14
              85 100
                      77
                          89 76
## student-15
              85
                  65
                      76
                          89
                              0
## student-16
              92 100
                     74
                          89 77
## student-17
                          86 78
              88
                  63 100
## student-18
              91
                   0 100
                          87 100
## student-19
              91
                  68
                      75
                          86
                             79
## student-20 91
                  68
                      76
                          88
```

Now we can use apply on our "masked" scores

## apply(mask,2,mean)

```
## hw1 hw2 hw3 hw4 hw5
## 89.00 72.80 80.80 85.15 79.25
```

Q4. Optional Extension: From your analysis of the gradebook, which homework was most predictive of overall score (i.e. highest correlation with average grade score)? [1pt]

Here we will use the **cor()** function here

```
cor(mask$hw5, ans)
```

## ## [1] 0.6325982

I can call the **cor()** for every homework and get a value for each but that sucks. Let's use **apply()** and do them all in one go.

```
apply(mask,2,cor, ans)
```

```
## hw1 hw2 hw3 hw4 hw5
## 0.4250204 0.1767780 0.3042561 0.3810884 0.6325982
```

Make a boxplot

boxplot(scores)
